

### **DS110 Final Project**

# Divorce Prediction

Daniel Doh & Sophie Lim

## **Problem Statement**

 The goal of our project was to find out the most important factors that lead to divorce within married couples.

## **Backstory**

 Originally, we wanted to analyze a dataset that was interesting to us (Top 100 kdramas). However, we found that the dataset contained no trends for analysis, so we switched to another data set containing factors predicting divorce.

## **Methods**

 We used three different classification models: Logistic Regression, K-Nearest Neighbors, and Random Forest.

## Challenges

 With our new data set, our data was very categorical, so we couldn't initially get nice visualizations. We overcame this issue by using Python visualization libraries such as Shap and plotly express.

## Results

 Our models differed slightly in which factors they weighted more in their analysis. But they all tended to agree that measurements of aggression, communication, and goals influenced divorce the most.

#### **Logistic Regression/ Random Forest**

#### **K- Nearest Neighbors**

## **Conclusions**

- We do have suspicions of overfitting since our models scored exceptionally well. However, that's not something we can check unless we get more data.
- We learned how to use scikit- learn modules and other machine learning visualization libraries such as Shap and plotly express.
